

I build **trust between strangers**. I studied the psychology of it (BA Psychology & Sociology), grew up inside a Marwari trading family where deals ran on a name and a vouch, and have spent the last few years engineering it — an identity-infrastructure startup, a React Native crypto wallet taken solo to a live mainnet swap, and trust-and-safety platforms. Front-end-heavy full-stack; three years of daily LLM-assisted engineering.

THE KIKI BUILD — MADE FOR THIS APPLICATION

A working Kiki, three ways · React Native (Expo) + web + live AI

kiki-portfolio-one.vercel.app

- A native iOS build, the same app as a desktop/mobile web sibling, and a showcase + design record (13 handoffs) — built from the manifesto screenshots. Try it four ways: browser emulator, phone QR, web app, native from source.
- Trust graph with “two steps from you” degree-sorting, a bespoke Web-Mercator map (faces as pins, ring encodes degrees, never price), in-app messaging, guest book, similarity matching.
- Live Gemini “mutual friend” intro: structured facts from the graph → server-side key → cached fallback, constrained to state only what the graph can prove (says plainly what it can’t).
- Pure, framework-free domain layer (unit-tested) shared across all three builds. Source: kiki-ios · kiki-connect · kiki-showcase.

EXPERIENCE

Founding Engineer — Nextus (identity infrastructure startup)

May 2026 – Present

Sole engineer on the gateway for an identity-before-signup primitive — literally “is this person who they say they are, and can I trust this connection?”, the problem under Kiki.

- Node.js / Express / PostgreSQL (Prisma) / Redis / Zod. Immutable event log (7 typed events, correlation IDs), Stripe-style idempotency keys, Redis-backed rate limits, Helmet.
- Deliberate consistency model: strong on writes (identity + interaction + graph edge in one transaction), eventual on reads (invalidated cache). ~1,500 LOC, 131 tests; authored the OTP threat model.

Founding Engineer — Cache Wallet (crypto wallet startup)

Jan 2026 – May 2026

Built the first functional prototype from an abandoned codebase, solo, to launch-readiness — backend, mobile, smart contracts and infra.

- TypeScript / NestJS / React Native (Expo) / Solidity / Ethers.js. Gasless same- and cross-chain swaps with EIP-712 signed orders and a provider-agnostic execution layer; live mainnet USDC→WETH swap on Base with real funds. 7 EVM networks.
- Security hardening: patched IDOR vulns, migrated to short-lived JWTs with rotation, cut dependency vulnerabilities 60 → 8. On-device key custody (keys never leave the device).

Software Engineer — Freelance (Cwtch Comfort & others)

Mar 2025 – Present

Discovery → build → deploy → handover for UK businesses; several shipped and live.

- cwtchcomfort.com (Next.js 14, live on Vercel), built end-to-end solo: ~6,400 products across 12 supplier brands normalised by an ETL pipeline into one schema; Stripe checkout with server-side price validation; sofa/bed/wardrobe configurators with live pricing. ~52% net-margin strategy; revenue launch pending Stripe live keys.
- Companion FastAPI billing/ops system covering the full retail lifecycle (17 tests + scripted E2E). pawtrove.shop (Shopify, SEO 100). ML: Ollama vision pipeline classifying ~8,000 product images.

Software Developer Intern — Cardiff University, School of Architecture

Jun 2024 – Oct 2024

- Co-developed InvestigationMap (Flask / PostgreSQL / NLP pipelines), the production evolution of my dissertation — an interactive map making a city of messy, geo-tagged human entries readable at a glance. Improved sentiment throughput +25% (2,900+ entries/sec) at ingest scale.

Business & IT Manager — Viratra Handloom Tex (India)

May 2019 – May 2021

- Built an in-house ML design-intelligence platform: computer vision (OpenCV) + CNN embeddings (TensorFlow/Keras) + FAISS “find similar” vector search across the catalogue — similarity-at-scale years before it was common. Electron desktop app for non-technical staff.

Business Development Manager — Sri Viratra Jewellers & Finance (India)

Jun 2021 – Jul 2023

- In a jewellery-and-loan business trust is the product. Built a CRM (Electron/React/SQLite) to codify lending decisions for 1,000+ high-value clients; ~30% fewer manual errors, ~25–30% efficiency gain — my first commercial software shipped to non-technical users.

EDUCATION

MSc Computing — Cardiff University

2023 – 2024

Dissertation “Little Investigators” — a geo-emotion mapping platform for the Built Environment Trust (real client): London schoolchildren annotate their area; spaCy NLP, NSFW moderation, Presidio PII anonymisation, GDPR privacy-by-design. Trust & safety, by design.

BA Psychology, Sociology & English Literature — Christ University, Bangalore

2016 – 2019

SKILLS

Mobile / Front-end: React Native (Expo), React, Next.js 14, TypeScript, Tailwind, Reanimated, react-native-svg.

AI / LLM: LLM app dev (RAG, agents, prompt engineering), Gemini API, local inference (Ollama), spaCy, Hugging Face Transformers.

Web3: Solidity, Ethers.js, Thirdweb, EIP-712, multi-chain RPC (7 EVM), on-device key custody.

Trust / Graph / Identity: connection graphs, shortest-path, similarity search (FAISS, sentence-transformers), event-log identity systems, threat modelling, GDPR privacy-by-design.

Backend: Node.js, NestJS, Express, FastAPI, PostgreSQL/Prisma, Redis, REST/webhooks, idempotency, Zod.

Payments / DevOps: Stripe (checkout/webhooks), Vercel, Docker, Sentry, GitHub Actions, pytest/Jest.
